

Penetration Testing Task

1. Is the "macdonalds.com" domain reachable?

To determine whether the domain macdonalds.com is reachable, a ping test was performed using the command "ping macdonalds.com" in the Kali Linux terminal. The results showed that the system successfully received reply packets from the server. The output indicated that 30 packets were transmitted and 30 packets were received with 0% packet loss. This confirms that the domain is reachable and responding to network requests. A screenshot of the ping command and its output should be included as evidence.

2. What is the IP address of "macdonalds.com"?

The IP address of macdonalds.com was identified using the nslookup command. This command queries the Domain Name System (DNS) to retrieve the IP address associated with a domain name. After running "nslookup macdonalds.com", the system returned the public IP address 64.190.63.222. This confirms that the domain resolves correctly through DNS and that the server can be identified on the network. A screenshot of the command output should be included as supporting evidence.

3. Solutions if your email appears in a data breach

If an email address becomes involved in a data breach, several steps should be taken to reduce the risk of further compromise. The first action would be to immediately change the password for the affected account to prevent unauthorised access. It is also important to enable multi-factor authentication so that an additional verification step is required when logging in. Finally, using a password manager and ensuring that every account has a unique and strong password helps minimise the damage if one account becomes exposed in a breach.

4. Subdomains of "burgerking.com"

Subdomains of burgerking.com were discovered using the Assetfinder reconnaissance tool in Kali Linux. The command "assetfinder burgerking.com" was executed to enumerate publicly available subdomains associated with the domain. The first seven results returned by the tool were burgerking.com, bk-world-prd-01.burgerking.com, bk-world-prd-02.burgerking.com, latam02.burgerking.com, 05193.e.mail.burgerking.com, link.mail.burgerking.com, and www.burgerking.com. These subdomains demonstrate how organisations often operate multiple services and systems under a single domain. A screenshot of the terminal output should be included as supporting evidence.

5. Version of the first JavaScript library listed for "amazon.com"

The technologies used by Amazon were analysed using the Wappalyzer browser extension. After opening amazon.com in Firefox and activating the Wappalyzer extension, the panel displayed a list of technologies used on the website. Under the JavaScript libraries section, the first library detected was jQuery. Another library detected on the page was core-js version 3.17.3. These results demonstrate how tools such as Wappalyzer can help identify the technologies used to build and maintain modern web applications. A screenshot of the Wappalyzer results should be included as evidence.

6. Using Google syntax to identify a Samsung cellphone winner

Advanced Google search syntax was used to locate a Samsung PDF document that references the

name Amanda Sue. The search query "site:samsung.com 'Amanda Sue' filetype:pdf" was entered into Google. This query restricts results to documents hosted on the samsung.com domain and only returns PDF files containing the specified name. The search results displayed a document titled "Galaxy A Series", which includes the name Amanda Sue Ming Quah. This confirms that the Google search operators successfully identified the required PDF file. A screenshot of the search results should be included as evidence.
